Basic Penguin Facts 📄

Antarctic penguins have a striking black and white coat. The distinctive colours and features of each penguin species are on their heads and neck — some are black and white, some have yellow patches, and others have elaborate coloured eyebrows.

All penguins have similar body form and structure, but they vary greatly in size, from the little penguin weighing 1.1kg and about 40cm tall, to the emperor penguin, which weighs up to 40kg and is about 115cm tall.

Penguins stand for hours on ice, but they have two clever ways of keeping their feet the right temperature — a few degrees above freezing. Blood flow to their feet is tightly controlled, with reduced flow in cold conditions. Heat exchangers at the top of their legs take heat from the blood flowing to the feet, and

it might be nice for the video to take the whole screen on a browser window, but would these dimensions translate well to mobile? this is the solution I have for now: smaller video with images next to it, which will appear under it on mobile

My plan is that the video will not autoplay and the user will click to start - is this ok?

Penguin Fun Facts

where the name penguin comes from

what do they eat?

The Linux operating system has a penguin called Tux as its mascot, and the original version of this penguin is the logo you can see next to the title above

Fossil records show that penguins evolved from flying birds (petrels) about 50 million years ago. There were at least 25 species, many of which have become extinct. Some fossil penguins were larger than the ones that exist today, with one species almost as tall as a human (170cm).

A group of penguins on land is called a waddle, and a group of penguins in the water is a raft
